Problem Statement

Our users are frustrated when attempting to split the bill between drinkers and nondrinkers. Drinkers may take advantage of bill splitting to buy multiple drinks causing a split of the bill to be unfair. Our solution would provide users with an easy way to split the bill without taking drinks into consideration.

Who does this affect?

This problem affects people that go out to places that may sell drinks. Examples include restaurants and bars with at least one person drinking and one person not drinking.

Where does this problem present itself?

This problem presents itself primarily at restaurants and bars but can occur at other places such as movie theaters, sports events, etc.

Why does this matter?

This matters because alcohol in public can become very expensive, and it can become an issue if a nondrinker is forced to cover part of a tab for alcohol.
